- The 10 Green Commandments
- Solar architecture
- Energy
- Materials
- Buildings

Green architecture | | Dipl.-Ing. Roman Grüner

What is green architecture

Green architecture | | Dipl.-Ing. Roman Grüner

The 10 Green Commandments

1. Green urbanism
2. Relationship to nature, climate
3. Local traditions, architecture as an ecosystem
4. Environment friendly materials
5. Energy savings in building operation
6. Alternative energy sources
7. Life-cycle management
8. Adapting to the needs
9. Greenery and architecture
10. Combination of the principles

Ing. arch. Henrich Pifko, PhD.
IEPD, FA Bratislava

Green architecture | | Dipl.-Ing. Roman Grünner

1. Green urbanism

Leaving the cities – ideal of many people

Result: destruction of recreation and agricultural areas
heterogenous living mash
mostly depending on car traffic
collaps

Solution: adding greenery
rising quality of life
providing diversity of housing
social qualities

Green architecture |

2. Relationship to nature, climate

Respons of the architecture to nature

Invasive dimensions

Soil sealing with asphalt and concrete

Solar architecture - adapting to local clima,
- wintergardens,
- shaded atrium

Green architecture | | Dipl.-Ing. Roman Grünner

3. Local traditions, architecture as an ecosystem

Tradition is not directly related to environmental protection, but rather the protection of identity, genius loci and socio-cultural values.

The traditional approach is often a considerate approach to environment, generations of experience helping in choosing a suitable site and to optimize the design and choice of materials.

Green architecture | | Dipl.-Ing. Roman Grüner

4. Environment friendly materials

- materials from renewable resources (wood in the forest grow back if it reasonably taken)
- or from abundantly available sources,
- energy efficient,
- recycled (such as cellulose insulation)
- and recyclable
- materials that do not harm the environment when manufactured, in construction, by operation or liquidation.

Green architecture | | Dipl.-Ing. Roman Grüner

5. Energy savings in building operation

- Lowering energy consumption in buildings
- Energy for heating
- Energy for warm water
- Electricity

- Low energy houses
- Passive houses

Green architecture | | Dipl.-Ing. Roman Grüner

6. Alternative energy sources

- Even energy efficient building need energy
- Can be covered from renewable sources
- Photovoltaics
- Heat pump
- Solar collectors

Green architecture | | Dipl.-Ing. Roman Grüner

7. Life-cycle management

„Lifecycle analysis is important with relevance to the realisation of sustainable development in the construction sector as the basis for decision-making in the design and planning stage“

Prof. Graubner, TU Darmstadt, Inst. F. Massivbau

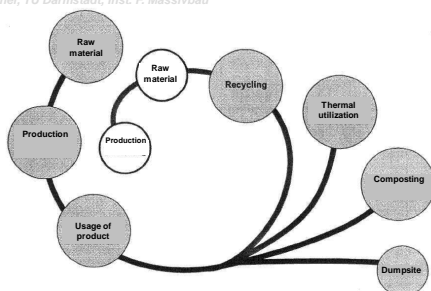

Fig 1 - The life-cycle of a product – "from the cradle to the grave".

Green architecture | | Dipl.-Ing. Roman Grüner

8. Adapting to the needs

- People mostly cannot define the size of their needs
 - Result: unnecessarily big houses, gardens, cars
 - City streets designed for cars
 - Missing link to open spaces

Green architecture | | Dipl.-Ing. Roman Grüner

9. Greenery and architecture

- Plants can become part of architecture, not only addition

10. Combination of the principles

- Partial solution are not effective
- synergistic effect of active measures can push the architectural value to a qualitatively higher level.

Sustainability

Historical Development:

The term originates in German language from the forest industry. First mentioned in 12th century.

1144: Forest arrangement of the alsatian cloister Mauerminster - „not to cut more wood than it can grow back again“.

1480: Requirement - „to preserve the forest, because the progeny will once also need it“.

1713: Saxony Captain Hans Carl von Carlowitz demanded in „Sylvicultura Oeconomica“, „that a continuing sustainable use should become indispensable“.

Green architecture | | Dipl.-Ing. Roman Grüner

Green architecture = Sustainable architecture

Sustainability

1992: Earth Summit in Rio de Janeiro defined the sustainable development as a development, that can be continued over the whole earth without affecting the natural balance and the society in their functionality.

1997 and 1998 the EN ISO 14.040 and 14.041 were published, handling the Ecobalancing, replacing the simple SETAC Scheme.

1999 Contract of Amsterdam: Sustainability is and intangible part of the European Union.

2001 Göteborg: European council adds the environmental dimension to the social and economic dimension.

Green architecture | | Dipl.-Ing. Roman Grüner

Resources in Building Industry

-Energy: for Material production, operating buildings, demolition and disposal

-Soil: ground for building, living space for organisms and production of biomass, oxygen and drinking-water

-water: living space, origin of life

-Resources: renewable vs. non-renewable resources.

Passive solar-technical components

Passive sun-energy utilisation, Sun-windows, Windows-glazings

Resource-orientated Constructions | Univ. Prof. Arch. DI. Dr. Martin Treberspurg

Definition

Precondition: positive energy balance

Passive sun-technical components: more energy is lead through their capturing (glazed) solar-collection-surface into the interior as the energy lost through heat-transmission via the entire component.

3 types:

- Sun-windows, glazes façade elements
- Sun-energy winning wallsystems, Trombé walls, walls with transparent heat-insulation
- wintergardens, glazed buffer rooms, glazed areas

Resource-orientated Constructions | Univ. Prof. Arch. DI. Dr. Martin Treberspurg

Cooperation of 5 Elements

- Collector** (south-orientated solar collecting surfaces, e.g. windows, solar wall, wintergarden, sun-patio,...)
- Absorber** (surface, where the radiation is transformed into the heat, e.g. interior wall, floor,...)
- Heat accumulator** (z.B. walls, floor,...)
- Heat distribution** (through conduction, radiation and convection)
- Regulation** (ventilation opening, sun-protection, ventilators, mobile sun-protection...)

Resource-orientated Constructions | Univ. Prof. Arch. DI Dr. Martin Treberspurg

Passive use of the sun-energy

Direct gain of heat

Solar radiation falling direct through the glass surface is absorbed by the interior surface, transformed into heat and time-delayed delivered in the night and in the morning.

On cold sunny days, no heating is required = 100% solar coverage.

Resource-orientated Constructions | Univ. Prof. Arch. DI Dr. Martin Treberspurg

Passive use of the sun-energy

Indirect gain of heat

Through sun radiation, heated accumulation mass (e.g. 40-60° C on a black accumulation wall) releases at lower temperatures (e.g. 25-30° C at the inner wall) time-delayed the stored heat.

Resource-orientated Constructions | Univ. Prof. Arch. DI Dr. Martin Treberspurg

Passive use of the sun-energy

Isolated gain of heat

Sun energy is captured through indirect system, heat accumulator and room to heat are detached.

Stadlau

Wien 22 (Austria) - ARGE Reinberg, Treberspurg, Raith (1989-91)

Planning: Arge Reinberg - Treberspurg - Raith
 Location: Vienna XXII
 Constructor: Neues Leben - Gemeinnützige Bau-, Wohn- und Siedlungsgenossenschaft
 Project data: 10 terraced houses and one community center,
 Area: 2.251 m²
 Finished: 1991
 Energy index: 70 kWh/m²a
 Building costs: 12 000 05/m²

Resource-orientated Constructions | Univ. Prof. Arch. DI Dr. Martin Treberspurg

1. Function: Energy earning

When the temperature in glass house is approx. 2° C higher than in the living room, the ventilation barrel opens a connection between the glass house and the house interior.
 (in winter up to a temperature of 26° C, in summer max up to 20° C).

Source: ARGE Reinberg, Treberspurg, Raith

Resource-orientated Constructions | Univ. Prof. Arch. DI Dr. Martin Treberspurg

2. Function: Protection against extreme overheating and ventilation:

When the temperature in glass house becomes higher than the one in living space.

Source: ARGE Reinberg, Treberspurg, Raith

Resource-orientated Constructions | Univ. Prof. Arch. DI Dr. Martin Treberspurg

3. Function: Ventilation of the Bedroom

This function is not automated, has to be operated manually.

Source: ARGE Reinberg, Treberspurg, Raith

Resource-orientated Constructions | Univ. Prof. Arch. DI Dr. Martin Treberspurg

4. Function: The Glasshouse is separated from the house.

This function is not automated, has to be operated manually.

TERRACED HOUSE - NATURE NEARBY LIVING Fred Raymondgasse 19, 1220 Vienna

OBJECT DATA

Type:	New Building of Terraced Houses
Constructor:	Stadt Vienna, MA 24
General Planning:	Arch. DI Dr. Martin Treberspurg
Bauphysics:	DI Wilhelm Hofbauer
Completed:	1996
Dimension:	4.300 m ²
Amount :	41 accommodation units, 1 community centre
Heating energy demand:	40 kWh/(m ² a)
Netto Building Costs:	ca. 5,23 Mio. EURO

Resource-orientated Constructions | Univ. Prof. Arch. DI. Dr. Martin Treberspurg

Quelle: H3Z-Projekt 08/2004; Geisler et al., 2004

Auswertung für Nutzer, Eigentümer, Investor

Zertifikate für nachhaltige Gebäude: IBO ÖKOPASS

Qualitätskriterien:

Nutzungsqualität

- Behaglichkeit im Sommer und Winter
- Innenraumluftqualität
- Schallschutz
- Tageslicht und Besonnung
- Elektromagnetische Qualität

Ökologische Qualität

- Ökologische Qualität der Baustoffe und Konstruktionen
- Gesamtennergiekonzept
- Wassernutzung

Energy standards

Use of energy standards:

Comparability of figures (standardised classification) through national implementation

Increase in market transparency for renters, buyers and investors

Suggests recommended improvement measures to property owners

Assures quality to customers of newly built houses and renovation standards

Marketing-instrument for residential and real estate sector

Principles of the Passive House Concept

Definition (Passivhaus Institute Darmstadt - Dr. Feist):
A Passive House is a building, for which thermal comfort can be achieved solely by postheating or postcooling of the fresh air mass, which is required to fulfill sufficient indoor air quality conditions - without a need for recirculated air.

- Optimizing the building shell
- Loss minimizing before Profit Maximizing

Green architecture | | Dipl.-Ing. Roman Grüner

Conventional House VS Passive House

Losses – Gains
 = Heating energy requirement

[source: HfZ - Passivhaus Schulungsunterlagen, 1.3 Ressourcenverbrauch im Gebäudebetrieb]

Green architecture | | Dipl.-Ing. Roman Grüner

Building Envelope: Comfort Windows

Example of triple pane glazing window

Window $\leq 0,8 \text{ W}/(\text{m}^2\text{K})$ (R-7.1)

[source: Passivhaus Institut]

Green architecture | | Dipl.-Ing. Roman Grüner

Building Envelope: Comfort Windows

Passive House Window, Interior

Infrared pictures of an old building and a passive house (at the bottom) for comparison (photos: PHI)

passive house: triple pane windows and an excellent insulation

Green architecture | | Dipl.-Ing. Roman Grüner

Building Envelope: Avoiding Thermal Bridges

Green architecture | | Dipl.-Ing. Roman Grüner

Building Envelope: Airtight Construction

- ◆ avoid damage caused by condensation of moist, room warm air penetrating the construction
- ◆ reduce losses through building envelope and ventilation

Green architecture | | Dipl.-Ing. Roman Grüner

Evolution

„1-Liter Car“
Over 80% Energy savings

„1-Liter House“ = Passivhaus:
Since 1991
Over 90% Energy savings

Green architecture | | Dipl.-Ing. Roman Grüner

General refurbishment 2007

Factor 10 - Refurbishment

- 3 app. houses with 42 flats
- Example: Rankweil-Schleipweg (18 Wo)
- refurb. scale – ÖKO 3:
 - ◆ Upgraded insulation facade 26 cm
 - ◆ Window / Shutter renovation
 - ◆ New roof with insulation
 - ◆ Balcony glazings
 - ◆ Ventilation with heat recovery
 - ◆ Heating system renovation
 - ◆ Solar facility on the roof
 - ◆ Airtight building envelope
- Heat energy demand after:
15 kWh/m²/a
- Costs netto: € 925.000,-
